配置规则

```
1  =head1 CONFIGURATION
2
```

Protected paths can be set both at the site and user levels.

Both of these configuration files can contain a list of important files
or directories (one per line):

    /etc/safe-rm.conf
    ~/.config/safe-rm

If both of these are empty, a default list of important paths will be
used.

=for stopword Wildcards
Wildcards are allowed in the configuration files, but be careful

    /usr/lib/*

will protect all of the files inside the /usr/lib directory if
they are referred to directly, but it will not protect your
system against:

    rm -rf /usr/lib

For a full protection, you should include both of these lines:

    /usr/lib
    /usr/lib/*

=head1 EXIT STATUS

Same exit status as the real rm command.

Note that if all file arguments are skipped by safe-rm then the exit status
will be the same as the exit status of the real rm when no files arguments
are present.

=head1 BUGS AND LIMITATIONS

Note that if you put the following in your protected paths list:

```
$ cat /etc/safe-rm.conf
/usr/lib
```

Then safe-rm will prevent you from deleting the directory:

```
$ rm -rf /usr/lib
Skipping /usr/lib
/bin/rm: missing operand
Try `/bin/rm --help' for more information.
```

However it cannot protect you from the following:

```
$ cd /usr/lib
$ rm -f *
```
